Report: Google Maps integration status

MyTruck Delivery app | 11 Nov 2026

Summary

The Google Maps code is finished and tested. The maps are not yet live, because Google has not yet accepted the billing account for the project. The billing account was reopened today, and the last check still reported billing as the blocker. Google can take up to 15 minutes to apply a reopened account, so the key must be retested.

What has been built

- Google map on Android, replacing the previous web-page map.
- Address lookup and place search through Google Geocoding.
- Real road distance and travel time through the Google Routes API.
- Live map on the driver's Active Mission screen, showing the driver, the store, the customer and the route.
- Customer tracking shows the road distance and time to the customer.
- OpenStreetMap and Gebeta map services removed from the app.
- Fallbacks: if Google is unavailable, addresses use the phone's geocoder and distance shows as straight-line.

Setup status

Item	Status	Note
Maps SDK for Android	Enabled	Enabled on project mytruck-delivery
Geocoding API	Enabled	Enabled; blocked by billing
Routes API	Enabled	Enabled; blocked by billing
Billing account	Reopened	Confirm it shows Open and is linked
New Maps key	Created	Restricted to the three APIs; stored in build settings
Live check of key	Pending	Last check still reported billing; retest needed

Not yet verified

- The map drawing and live driver marker on a real phone (only checked in code).
- Address search and road routes, until the key check passes.

Security

- The Google key was shared in the project chat and was already public in the GitHub history. It must be replaced with a new restricted key after the maps work.
- Set a budget alert on the Google project, to limit unexpected charges.

Decisions needed

- Checkout delivery fee: keep straight-line distance (current), or switch to road distance (raises fees about 20 to 30 percent).
- Approve the monthly budget for Google Maps usage.

Next steps

- 1. Confirm the billing account shows Open and is linked to mytruck-delivery. (Owner: project owner)
- 2. Retest the Maps key; the check passes when addresses and routes return results. (Owner:

developer)

- 3. Test the map on two real phones: picking an address, and the driver's live route. (Owner: developer and QA)
- 4. Replace the exposed key with a new restricted key. (Owner: developer)
- 5. Commit and build version 1.0.8. (Owner: developer, after approval)
