Report: Password reset - Firebase upgrade needed

MyTruck Delivery app | 11 Nov 2026

Summary

The password reset update needs the Firebase project to be upgraded to the Blaze plan. Without it, the SMS code reset cannot be built or run.

Why the upgrade is needed

- The SMS reset needs a server to send codes and set new passwords. In Firebase, that server is Cloud Functions.
- Cloud Functions only run on the Blaze (pay as you go) plan. The current Spark (free) plan cannot run them.
- The project's billing account has been reopened, so the upgrade can now be done.

What the upgrade enables

- SMS password reset for all phone accounts.
- The Chapa payment server and driver nearest-first offers, which are already written and waiting for this upgrade.
- Secure storage for the SMS key, so it is never in the app.

Cost

- Blaze charges only for what is used. At the current size, most usage falls inside the free allowance.
- The main ongoing cost is the SMS messages, paid to the SMS provider.
- A budget alert will be set so costs can be watched.

What is needed

- 1. Upgrade the project mytruck-delivery to Blaze. (Owner: project owner)
- 2. Set the SMS key as a Firebase secret, outside the app. (Owner: developer)
- 3. Approve the budget limit for alerts. (Owner: project owner)

Risks if not upgraded

- Password reset by SMS stays unavailable, and phone-only accounts depend on support.
- The Chapa payment server stays off, so online payment keeps using the less secure fallback.

Next steps

- 1. Upgrade to Blaze. (Owner: project owner)
- 2. Set the SMS secret and deploy the functions. (Owner: developer)
- 3. Test one SMS reset end to end on a real phone. (Owner: developer and QA)
